Financial Performance Analysis by Market

AdventureWorks · SQL Analysis Project, 2026

Designed and executed a territorial profitability analysis in SQL (JOINs, views, data cleaning) to prioritize marketing investment. Revenue, gross profit, margin, and ROI were calculated by country, validated with quality-control checks, and synthesized into an executive report using the Context → Finding → Implication (C→F→I) methodology.

Highest ROI	Highest margin	Highest revenue	Highest campaign cost
+75.75%	**44.76%**	**$3.35M**	**$2.30M**
United States	Canada	United States	United Kingdom

SQL Script Sample — KPI Calculation by Territory

```sql
SELECT
    p.country,
    p.territory_key,
    SUM(p.revenue)::integer AS revenue,
    SUM(p.cost)::integer AS cost,
    COALESCE(SUM(c.campaign_cost), 0)::integer AS campaign_cost,

-- Calculate gross_profit = sum(p.revenue)::integer - sum(p.cost)::integer
    sum(p.revenue)::integer - sum (p.cost)::integer AS gross_profit,
-- margin_pct = (Revenue - Cost) / Revenue * 100
    ((sum(p.revenue) - sum (p.cost))*100.0)/nullif(sum(p.revenue),0) AS margin_pct,
-- roi_pct = Sum(Revenue - Cost) / CampaignCost * 100, using nullif to avoid divide-by-zero
--   margin_pct = (Revenue - Cost) / Revenue * 100
((sum(p.revenue)-sum(p.cost))*100.0)/nullif(SUM(c.campaign_cost),0) AS roi_pct

FROM country_revenue_cost AS p
LEFT JOIN country_campaigns AS c
  ON p.territory_key = c.territory_key
GROUP BY
    p.country,
    p.territory_key
ORDER BY
    p.territory_key, revenue, cost;
```

Representative snippet of the process: the final query combines this and other prior views (cleaning, joins, and QA).
